

SoLID $4 \times 24^\circ$ ϕ cut (2π bins)
 FOM in $(\theta_h, q_T/Q)$ per (x, Q^2) cell — ϕ_h restricted to $\theta_h \in [8^\circ, 18^\circ]$; $W > 2.3$ GeV, $0.3 < z < 0.7$, statistical only

$q_T/Q = p_T/(zQ)$
 panel rows: Q^2 in steps of 1 GeV^2

hadron lab polar angle θ_h [deg]
 panel columns: x in steps of 0.1
