

SoLID $4 \times 24^\circ$ ϕ cut (2π bins)

FOM in $(\theta_h, q_T/Q)$ per (x, Q^2) cell — each row's FOM spread uniformly over ϕ_h ; dashed: SoLID $8^\circ - 18^\circ$ hadron acceptance; $W > 2.3$ GeV, $0.3 < z < 0.7$, statistical only

$q_T/Q = p_T/(zQ)$
panel rows: Q^2 in steps of 1 GeV²
