

Estatraw_prop per bin — four 1° -histogram runs on the same 1660 bins
acceptance (phifull vs $4 \times 24^\circ$) $\times$ ϕ_S treatment (fold vs unfold)
the ϕ cut costs a factor ~ 4 at the median; folding ϕ_S costs nothing

— phifull, ϕ_S fold - - - phifull, ϕ_S unfold — $4 \times 24^\circ$, ϕ_S fold - - - $4 \times 24^\circ$, ϕ_S unfold
